

MTI offers a means of improving the quality of the whirlpool bath *while bathing*. It is 200 times stronger than household bleach, yet not a traditional chemical. It is safe and gentle enough to be used while bathing. In fact, it comes from the environment. It is Ozone, the purest form of Oxygen. And it is available in MTI's Ozone bath sanitation system.

Ozone has safely been used for years in commercial and residential pools, spas, aquariums, zoo life support, fountains, fish ponds, winery systems and multiple agricultural applications. While safe for the environment, it rids water of disease-causing microorganisms and leaves no chemical by-products in the water.

- The bath Ozonator, available in MTI whirlpool tubs, is a safe, effective and natural bath sanitation system that works while the user is enjoying a whirlpool bath.
- When the whirlpool pump is activated, the Ozonator system automatically begins operating in unison.
- Ozone gas, made naturally from the oxygen we breathe, is generated and immediately mixed into the recirculating bath water.
- Ozone, the most powerful oxidizer and disinfectant, kills all known bacteria, viruses, cysts, yeasts, molds and mildew and helps to rid the water of disease-causing microorganisms while you are enjoying the whirlpool bath.
- The longer the whirlpool is running, the more Ozone is infused and the purer the bath water becomes.
- When the whirlpool pump is turned off, the Ozone generator also turns off.
- Electrical Requirements: 1 amp, 110 VAC

Although ozone has been proven to be quite effective in providing clean whirlpool bathing water, regular cleaning of the internal plumbing system with a cleaner such as MTI's Fresh Wave should still be implemented. For optimum whirlpool plumbing system cleanliness and maintenance, MTI's Fill-Flush® or Simple Touch® whirlpool cleaning systems are also recommended.

Some Facts about Ozone and MTI's Ozonator

- MTI uses Ozone generators that are UL-approved for "safe out-gassing." This means that there is never a residual build-up of free Ozone in the contained space of a bathroom.
- The reason is that ozone as O_3 is formed within the Ozone unit by corona discharge; then passes through the tubing to mix with the water.
- **While in the water**, Ozone, nature's purest form of sanitizer and oxidation agent, is killing bacteria, fungus, microbes, etc.
- The key is that when the Ozone bubbles hit the surface of the water, **Ozone then turns back to Oxygen as O_2** . The out-gassing is perfectly safe.
- The NSF (National Sanitation Foundation) has approved not only the Ozone generator for the kill rate of bacteria, which is 99.9%, but also the out-gassing for safety standards.
